Application No.: 10/720,506

Office Action Dated: May 4, 2007

PATENT REPLY FILED UNDER EXPEDITED PROCEDURE PURSUANT TO 37 CFR § 1.116

This listing of claims will replace all prior versions, and listings, of claims in the application.

Listing of Claims:

1. (Currently Amended) A system for automatically generating source code from a

functional model comprising:

a computer display; and

a modeler for defining at least one of a plurality of code elements and a structure of a

code block and generating a graphical representation on said computer display displayed on a

computer of the at least one code element and structure of the code block, wherein the

modeler processes input comprising a code block of source code from an innermost element

to an outermost element and generates from the input a code model comprising a graphical

representation of a structure and flow of the code block.

2. (Currently Amended) The system of claim 1, further comprising a user interface for

receiving the definition of the at least one code element and the structure of the code block.

3. (Original) The system of claim 1, further comprising a selector for selecting at least

one of a plurality of programming languages in which to generate the source code from the

functional model.

4. (Original) The system of claim 3, further comprising a code generator for receiving

the graphical representation of the at least one code element and the structure of the code

block and the at least one programming language and generating source code in each of the at

least one programming languages.

5. (Original) The system of claim 2, wherein the at least one programming language

comprises C++.

6. (Previously Presented) The system of claim 2, wherein the at least one programming

language comprises C#.

PATENT REPLY FILED UNDER EXPEDITED PROCEDURE PURSUANT TO 37 CFR § 1.116

7. (Previously Presented) The system of claim 2, wherein the at least one programming

language comprises VB Script.

8. (Currently Amended) A method of automatically generating source code from a

functional software model comprising:

processing a block of programming code from an innermost element to an outermost

element and generating from the processed block of programming code a functional software

model;

defining a plurality of code elements within the block of programming code;

specifying a structure of the block of programming code including the plurality of

code elements; and

generating from the plurality of code elements and the structure of the block of

programming code including the plurality of code elements a graphical representation of the

plurality of code elements and flow of the block of programming code.

9. (Previously Presented) The method of claim 8, further comprising receiving the

definition of the plurality of code elements with the block of programming code and

specifying the structure of the block of programming code via a user interface.

10. (Original) The method of claim 8, further comprising specifying at least one target

language in which source code for the graphical representation is to be generated.

11. (Original) The method of claim 10, further comprising generating the source code in

the at least one target language.

12. (Previously Presented) The method of claim 8, wherein one of the plurality of code

elements comprises a variable, comment, constant, object, function, method, prototype,

member, data type, callback, delegate, reference, field, variant, property, interface, class,

type, enumeration, structure, primitive, array, or event handle.

13. (Previously Presented) The method of claim 8, wherein one of the plurality of code

elements comprises a code relation.

14. (Original) The method of claim 13, wherein the code relation comprises a

mathematical operator.

15. (Previously Presented) The method of claim 8, wherein one of the plurality of code

elements comprises an evaluation entity.

16. (Currently Amended) The method of claim 15, wherein the evaluation entity

comprises one of a method call, a plurality of code entities, a plurality of code relations, or an

instantiation of a class.

17. (Previously Presented) The method of claim 8, wherein one of the plurality of code

elements comprises a passive entity.

18. (Original) The method of claim 15, wherein the passive entity comprises a comment

or a modeling diagram.

19. (Previously Presented) The method of claim 8, wherein one of the plurality of code

elements comprises a block entity.

20. (Currently Amended) The method of claim 19, wherein the block entity comprises a

method entity, a member entity, a class entity, a namespace entity, or a file entity.

21. (Original) The method of claim 20, wherein a many-to-many relationship exists

between block entities.

PATENT REPLY FILED UNDER EXPEDITED PROCEDURE PURSUANT TO 37 CFR § 1.116

22. (Currently Amended) A computer-readable storage medium including computerreadable instructions for performing a method comprising:

processing a block of programming code from an innermost program element to an outermost program element and generating from the processed block of programming code a functional software model;

defining a plurality of code elements within the block of programming code;

specifying a structure of the block of programming code including the plurality of code elements; and

generating from the plurality of code elements and the structure of the block of programming code including the plurality of code elements a graphical representation of the plurality of code elements and flow of the block of programming code comprising the functional software model.
